

SIMÓN OCAMPO

Systems Analyst & Full Stack Developer

Systems Analyst and 5th-year Systems Engineering student with solid experience in Full Stack development, modern web frameworks, and agentic development: agent orchestration, MCP servers, and RAG pipelines. Independent researcher with publications in international Q1 journals.

EDUCATION

2022 –	2022 – 2025
Systems Engineering	Systems Analyst
UTN La Plata	UTN La Plata
Final year	Completed

SKILLS

Stack	Data & AI
Python · TypeScript · JavaScript · React · Next.js · Django · NestJS · Node.js · Tailwind CSS	PostgreSQL · SQLite · Supabase · Appwrite · RAG · vector stores (Chroma) · embeddings · local LLMs (Ollama) · pandas · scikit-learn · SimPy
Agentic development	Tools
Multi-agent orchestration · MCP servers · skills and subagents · context engineering · hook-driven pipeline automation · grounding evaluation	Git · Docker · CI/CD · Vite · Vercel · Azure · GSAP · Photoshop

PUBLICATIONS

Strategies for stage II of cosmological arguments
Ocampo, Simón Tadeo (2024). *International Journal for Philosophy of Religion* 96 (1): 55–88.

PROJECTS & EXPERIENCE

2026

PYTHON · REACT

Braingent STO

Orchestration layer over CLI coding agents: sessions, cross-machine sync and a knowledge vault. Backend written against the Python standard library alone, with no runtime dependencies. Terminal UI plus a React app. The update path is tested by use: code ships from a public clone into the private one.

2026

NEXT.JS · SUPABASE

Automotive Atlas

Car explorer in Next.js and TypeScript with shadcn/ui. Supabase pipelines that turn scraped, unstructured listings into a catalogue served from a CDN.

2026

REACT · TAILWIND

Legacy Core

Private digital archive as a React SPA. Media management with relational profiles, filters that survive navigation, and an interactive timeline.

2025 – 2026

NEXT.JS · NESTJS

MateKnow

Gamified learning platform on Next.js and NestJS over PostgreSQL. Real-time competitive modes over WebSockets that run and check LaTeX maths and programming challenges.

2025 – 2026

PYTHON · SIMPY

Blockchain Mempool Simulation

Discrete-event simulation of a Bitcoin mempool in Python with SimPy. Statistical models measuring transaction throughput as network conditions shift.

2024 – 2025

DJANGO · REACT

Kinesiology Centre Web App

Clinical management system in Django and React. REST API for medical records, with external sources wired in so the clinic stopped re-typing them.

2023 – 2024

PYTHON · TKINTER

Software for the Visually Impaired

Accessibility module in Python and Tkinter for a data-acquisition program. Google TTS/STT plus a keyboard layer that lets a blind user reach every function unaided.
